Recap: Induction

Assignment Project Exam Help

Suppose we want to prove that a property P(n) holds for all natural numbers n. Remember that the set of natural numbers N can be defined as follows:

Definition of Natural Number DOWCOGET.COM

• 0 is a natural number.

For any natural number, n+tispalso a natural number. Add WeChat powcoder

Recap: Induction

Therefore, to show P(n) for all p, in the project P(n) for all P(n) for all p, and P(n) for all P(n) for al

2 assuming P(k) (the *inductive hypothesis*),

 $\Rightarrow P(k+1)$ (the inductive case). https://powcoder.com

Example

Induction

0000

Show that $f(n) = n^2$ for all $n \in \mathbb{N}$, where:

Add We Chat powcoder
$$\begin{cases}
2n-1+f(n-1) & \text{if } n>0
\end{cases}$$

(done on iPad)

Induction on Lists

Hast Assignment Projects Exam Help

Definition of Haskell Lists

- For any list xs, xx, xs is also hist tor any list xs, xx is also hist tor any list xs, xx is also hist tor any list xs.
- This means, if we want to prove that a property P(1s) holds for all lists 1s, it suffices to show: Add WeChat powcoder

 P([]) (the base case) to show:

 - P(x:xs) for all items x, assuming the inductive hypothesis P(xs).

Induction on Lists: Example

```
Assignment Project Exam Help
sum (x:xs) = x + sum xs -- 2
```

```
foldr :: (a https://powcoder.com
foldr f z (x:xs) = x \hat{f} foldr f z xs --B
```

Add WeChat powcoder

Prove for all 1s.

```
sum ls == foldr (+) 0 ls
```

(done on iPad)

Induction

000

So face siegen ment ment le lipry, we might define:

```
type Point = (Float, Float)

type Vector type Line

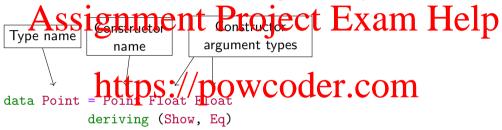

type Colour = (Int, Int, Int, Int) -- RGBA
```

```
movePoint :: Aidd We hat powcoder
movePoint (x,y) (dx,dy) = (x + dx, y + py)
```

But these definitions allow Points and Vectors to be used interchangeably, increasing the likelihood of errors.

Product Types

We can define our own compound types using the data keyword:

data Vector Acid FWe Cathat powcoder deriving (Show, Eq)

```
movePoint :: Point -> Vector -> Point
movePoint (Point x y) (Vector dx dy)
= Point (x + dx) (y + dy)
```

Records

But this has so many parameters, it's hard to tell which is which.

Haskell lets us declare these types as records, which is identical to the declaration style on the previous slide, but also gives us projection functions and record syntax:

```
data Colour = Colour { redC
        Add We Chatt powcoder
               } deriving (Show, Eq)
```

Here, the code redC (Colour 255 128 0 255) gives 255.

Enumeration Types

Similart Saingin ment we Paroject that alma Helphofined values:

```
data LineStyle = Solid

https://powcoder.com

deriving (Show, Eq)
```

data FillSty Addid We Contat powcoder deriving (Show, Eq.)

Types with more than one constructor are called *sum types*.

Algebraic Data Types

Just Ather interpretation two partitions are interpretations of shape:

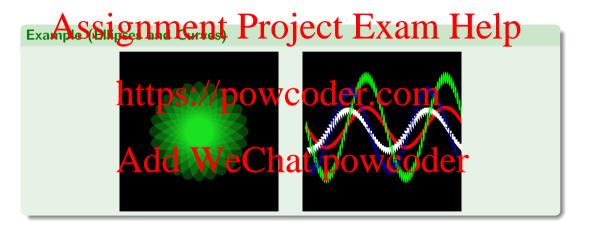

data PictureObject

```
= Path | Print | Colour LineStyle | Circle | Polygon | Polygon | Point | Colour LineStyle | FillStyle | Ellipse | Point | Float | Float | Float | Float | Powcoder |

| Actor | Colour LineStyle | FillStyle | Colour | Col
```

type Picture = [PictureObject]

Live Coding: Cool Graphics

Recursive and Parametric Types

Assignment Project Exam Help Data types can so be defined with parameters, such as the well known Maybe type, defined in the standard library:

Types can also be technise. If lips weren talleady tenned in the standard library, we could define them ourselves:

```
data List a = Nil | Cons a (List a)

We can even define Grand Number wheat is procedured Exero):
```

data Natural = Zero | Succ Natural

Types in Design

Sage Advice

An Assignmenty Projectis Exam Help

Make illegal states unrepresentable.

Choose types that constrain your implementation is much as possible. Then failure scenarios are eliminated automatically.

Example (Contact Details)

 $\stackrel{\mathtt{data\ Contact}}{A} \stackrel{\mathtt{Contact}}{A} \stackrel{\mathtt{Contact}}{A$

What failure state is eliminated here? Liam: also talk about other famous screwups

Partial Functions

Failure to follow Yaron's excellent advice leads to partial functions.

A partial function is a function not defined for all possible inputs.

Examples: head, tail, (!!), division

Partial functions are the sayord to be wish the cause your or grant to crash if undefined cases are encountered.

To eliminate partiality, we must either:

- enlarge the Addmain, Walley (ith have type we coder safeHead (x:xs) = Just xsafeHead [] = Nothing
- Or we must constrain the domain to be more specific:

```
safeHead' :: NonEmpty a -> a -- Q: How to define?
```

Type Classes

You Assignment Project Exam Help

- compare
- (==)
- https://powcoder.com
- show

These constraints are called *type classes*, and can be thought of as a set of types for which certain operations are implemented.

Show

The Show type class is a set of types that can be converted to strings. It is defined like:

```
clas Assignment Project Exam Help
```

Types are added to the type class as an *instance* like so:

```
instance Shohetepser/powcoder.com
 show False = "False"
```

We can also define instances that depend on other instances: instance Show Medical Down on the instances: show (Just x) = "Just " ++ show xshow Nothing = "Nothing"

Fortunately for us, Haskell supports automatically deriving instances for some classes, including Show.

Read

Assignment Project Exam Help
Type classes capalso overload based on the type returned, unlike similar features like
Java's interfaces:

```
read :: Sthigtps://powcoder.com
```

- read "34" :: Int WieChat powcoder
- show (read "34") :: String Type error!

Semigroup

Semigroups

A seAssignmentanProject: Examplete pation

Associativity is defined as, for all a, b, c:

https://poweoder.com

Haskell has a type dest or white ps! The associativity are included only by programmer discipline:

class Semigroup s where

(<>) :: s -> s -> s -- Law: (<>) must be associative.

What instances can you think of?

Semigroup

Lets Assignment : Project Exam Help

```
instance Semigroup Colour where

Colour r1 g1 b1 a1 <> Colour r2 g2 b2 a2

= Colon (the S1 +2) powcoder.com

(mix b1 b2)

where Add We Chat powcoder

mix x1 x2 = min 255 (x1 + x2)
```

Observe that associativity is satisfied.

Monoid

Monoids

A majerisa grannent equation of that $x \cdot z = x$ and $z \cdot y = y$ for all x, y.

class (Semigroup a) => Monoid a where mempty :: https://powcoder.com For colours, the identity element is transparent black:

instance Monoid Colour where

mempty = Copy do WeChat powcoder
For each of the semigroups discussed previously:

- Are they monoids?
- If so, what is the identity element?

Are there any semigroups that are not monoids?

Newtypes

The Assignment of Project Exam: Help

- The operation (+) is associative, with identity element 0
- The operation (*) is associative, with identity element 1

Haskell doesn't util Sthese paw to be defor Continuance per type per class in the entire program (including all dependencies and libraries used).

A common technique is to define a ceptate type that is represented identically to the original type, but ear have its own, different type class metances.

In Haskell, this is done with the newtype keyword.

Newtypes

A newtype declaration is much like a data declaration except that there can be only one constituting in the last exactly of a current. Xam Help newtype Score = S Integer

instance Semlittpsort/powcoder.com

mempty = SAdd WeChat powcoder

Here, Score is represented identically to Integer, and thus no performance penalty is incurred to convert between them.

In general, newtypes are a great way to prevent mistakes. Use them frequently!

Ord

Ord iA System Help

(<=) :: a -> a -> Bool

What laws should instances satisfy? For all x, y, an extract the satisfy?

- Reflexivity: $x \le x$.
- Transitivity: If x <= y and y <= z then x <= z.
 Antisymmetry: O <= ware <= then p = wcoder
- **1** Totality: Either $x \le y$ or $y \le x$

Relations that satisfy these four properties are called total orders. Without the fourth (totality), they are called partial orders.

Eq

Eq is a type class for equality or equivalence:

clas Assignment Project Exam Help

What laws should instances satisfy?

For all x, y, an hattps://powcoder.com

- 2 Transitivity: If x == y and y == z then x == z.
- Symmetry: A x = y why y = C hat powcoder

 Relations that satisfy these are called equivalence relations.

Some argue that the Eq class should be only for equality, requiring stricter laws like:

If x == y then f x == f y for all functions f

But this is debated.

Types and Values

Assignment Project Exam Help

Haskell is actually comprised of two languages.

- The value of the transpage, consisting of expression such of the let, 3 etc.
- The *type-level* language, consisting of types Int, Bool, synonyms like String, and type *constructors* like Maybe, (->), [] etc.

This type level language its what a cyph system powcoder

Kinds

Assignment Project Exam Help

Just as terms in the value level language are given types, terms in the type level language are given kinds.

The most basic lite in Stign a powcoder.com

- Types such as Int and Bool have kind *.
- Seeing as Maybe is parameterised by one argument, Maybe has kind * -> *: given a type (Tht) with etun at the (The country of the country

Lists

Sup Assignment Project Exam Help

```
toString :: Int -> String
```

And we also have a function to give us some numbers:

getNumbers: IntDOWCOGET.COM

How can I compose to String with getNumbers to get a function f of type Seed -> [String]?

Add WeChat powcoder Answer: we use map:

= map toString . getNumbers

Maybe

Supple Signment Project Exam Help to String :: Int -> String

And we also have a function that may give us a number:

tryNumber :: hetps://powcoder.com

How can I compose toString with tryNumber to get a function f of type Seed -> Maybe String?

We want a map funded but We Charte: powcoder

f = maybeMap toString . tryNumber

Let's implement it.

Functor

All of these functions are in the interface of a single type class, called Functor.

Support Project Exam Help

fmap :: (a -> b) -> f a -> f b

Unlike previous type classes we've seen like Ord and Semigroup, Functor is over types of kind * -> * $\frac{\text{https://powcoder.com}}{\text{total}}$

Instances for:

- Lists
- Add WeChat powcoder
- Tuples (how?)
- Functions (how?)

Demonstrate in live-coding

Functor Laws

Assignment Project Exam Help

```
finap id https://powcoder.com
finap f . fmap g == fmap (f . g)
```

This is due to *parametricity*, a property we will return to in Week 8 or 9

Homework

Assignment Project Exam Help

- Do the first programming exercise, and ask us on Piazza if you get stuck. It will be due in Attyp Seil # TO COMETUICOM
- 2 Last week's quiz is due this friday. Make sure you submit your answers.

$\begin{array}{c} \text{This week's quiz is also up, due next friday (the friday after this one).} \\ & Add \ WeChat \ powcoder \end{array}$
